Checklists

Here's what we need.

Desktop

- Button to add new stuff
- Nav items for the following:
 - Dashboard
 - Accounts
 - Transactions
 - Settings
- Logo (as is tradition, for users to go 'home')

Mobile

- Button to add new stuff
- Nav items for the following:
 - Dashboard
 - Accounts

- Transactions
 - Settings
- Logo (as is tradition, for users to go 'home')
 - Given the design I have in mind, I don't think we'll be able to squeeze this in, but that should be fine, considering it's not as a common a pattern to have the logo on mobile as on desktop.

Brainstorming

Mobile

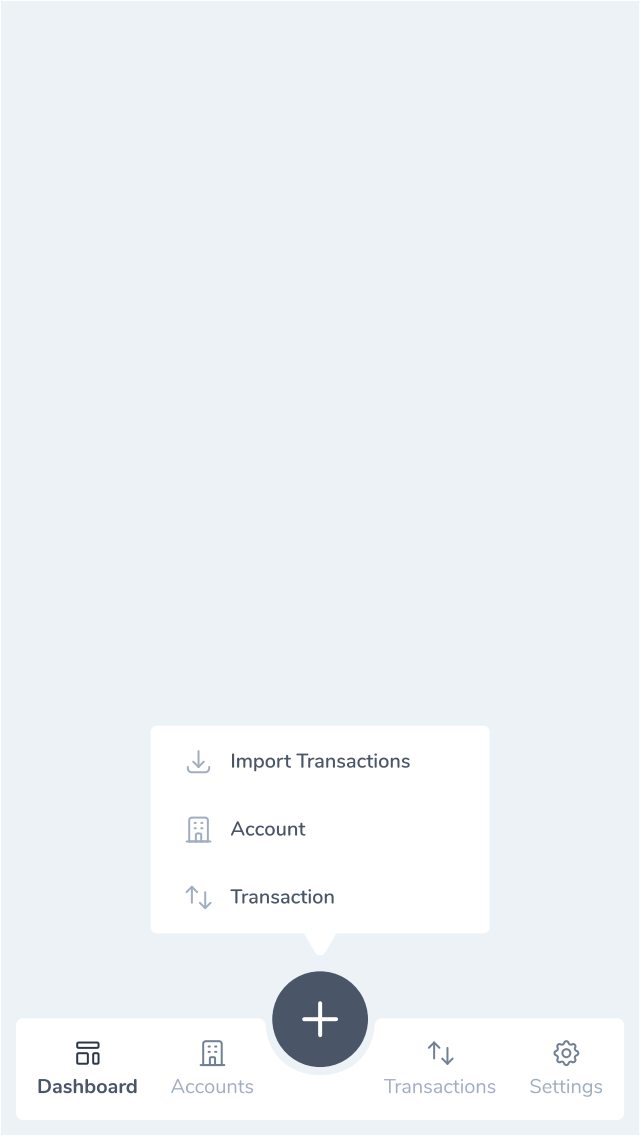

- For the mobile navigation, as the inspiration above would indicate, I'm thinking about a bottom navigation bar with the main elements.
- I'm also thinking of incorporating a FAB for handling the global Add action.
- Since we're not perfectly copying Material design (at all, in fact), I don't want to use some line of FABs as the menu from the main FAB. Instead, I think going with just a dropdown (that.. drops upwards?) is best, since it maintains the styling we have from other elements.
- Also, as much as the standard bottom navigation bar is just this kind of full width bar, I want to experiment with giving it some margin from the edges of the screen, so that it can have a drop shadow and rounded corners. I think that'd look nice.

Desktop

- For desktop, I'm thinking we can use the 'divider' style that we've been using throughout the app till now.
- That is, the top navigation 'bar' can just be flat onto the grey background, with a divider bar between it and the rest of the app.
- Additionally, the nav items (dashboard, accounts, and transactions) can have their active state show a underline on the divider.
- I don't know if the top nav should always extend the full width of the screen (well, obviously minus some side padding) or if it should have a max and the body content can overflow it.
 - I'm thinking we try it with the full width and see how it looks and adjusts as necessary. You know, *responsive*.
