

Adding a New Model Field

[incomplete]

This mostly covers the process for adding a new *optional* field to a model.

Adding a new required field requires all this and much more! (mostly updating tests and whatnot)

Frontend

- Model file
 - Class fields
 - `extractDataFields`
 - `validate`, if relevant
- `store.ts`
 - Add field to encryption schema, if relevant

Backend

- Add field to schema file
- Add field to model file
- Create migration to add field
- Update seeders, if relevant
