Tech Debt

Just a small collection of the most glaring tech debt issues in uFincs.

- Component hierarchy could be better structured by grouping components by type

- The Date context state should really be in Redux

- Cypress tests could use a refactoring

- Too many components; need to group them by feature/usage

- Transactions (CSV) import is probably a mess since I never use it

- The mess that is the Frontend `hooks` folder

- Haven't upgraded TypeScript versions because I'm too lazy to fix the saga types in later versions

- Account interest exists pretty much all but in final implementation (removed the input but never bothered implementing it after recurring transactions)

- Not putting a user_id column on the Transactions table — makes it so much harder for multi-tenancy

- The DateService — our usage and manipulation of dates is just a mess
