How to Update Terraform for Dashboard

We currently have a single Stackdriver dashboard: `ufincs-cluster`.

In order to make updates to the Terraform config for it, do the following:

i. Perform whatever changes need to be made from the UI.

ii. Export the JSON for the dashboard using `gcloud monitoring dashboards list --format json > terraform/modules/monitoring/cluster-dashboard.json`.

iii. Manually clean up the exported JSON.

   – Remove the brackets denoting the array.

      • Note: If we ever get to multiple dashboards, you'll need to isolate the JSON for each dashboard individually.

   – Remove the `etag` attribute at the start

   – Remove the `name` attribute at the end of dashboard declaration.

   – Prettify the JSON

iv. Run `kubails infra deploy` as usual.
