System Status Indicator

Inspiration

[redacted]

Checklists

Here's what we need for the System Status Indicator:

Desktop

- An icon to indicate 'activity'.

- An icon to indicate the actual system status (i.e. online, offline, etc).

- A dropdown to show the recent activity.

- A button to view all of the activity.

Mobile

Meh, it'll be close enough to the desktop version. Instead of showing a recent activity in a dialog, it should just redirect the user to the Activity page.

And I'm not going to design that yet. All of this is so far away as is...

Brainstorming

- Basically, this seems to be a tried and true pattern.

- Need a title, need some rows for the activity, and then a button to view all of the activity.

- I'm thinking we can also add some other actions, like manually syncing and going to settings.

  - The only setting I have in mind right now is to not show the System Status Indicator in the app header (cause users might get annoyed with it constantly changing colors and icons whenever they do anything).

    - It could instead go inside the Account dropdown if the user decides to hide it.
