# Idea: Improved Landing Page

The following document will go over the design details related to improving the landing, as outlined in Story ticket UFC-XXX.

## Acceptance Criteria

For reference, the following are the acceptance criteria for this ticket:

## Design Brainstorming

Since I've gone and found a react-based template for a really nice SaaS landing page, we have a couple of options for how to integrate it:

- We could keep it as a separate react 'app' from the uFincs app, and then have the Express server just serve the different bundles depending on the route (i.e. `/app` would point to the uFincs app, `/` would be the landing page(s)).

    - Note that this would require moving the Login and Sign Up pages under the `/app` route, since they are still part of the uFincs app.

    - This keeps the cleaning separation between the two bundles, but also introduces a bit more headache, since we then have to figure out how to serve both bundles during development.

    - Plus handling building each app separately, combining the bundles into one folder to get served by the Express server, etc...

    - It's a lot more work.

- Could fully integrate the template's code into the uFincs code base, but then do code-splitting using react-router so that it doesn't get loaded when in the app, and vice-versa.

    - This is probably the best tradeoff, assuming code splitting works as intended.

- Could fully integrate it without code splitting (this is the worst option IMO).
